

You can't keep your IT resources isolated from the world

Let's face it, even if you deploy the most up-to-date security infrastructure, it will be at risk when you're forced to grant external access to critical resources. Your systems might require maintenance or management from external providers; administrators might need external access for off-duty response, or an employee may simply need to work remotely.

So, how do you maintain top notch security and provide external access at the same time?

Secure and Seamless External Access

The **WALLIX Access Manager** provides secure and seamless external access to your critical infrastructure, without disrupting user experience:

- Utilize RDP and SSH HTML5 console
- Access and manage multiple Bastions from one multi-tenant **Access Manager**
- Audit and run **Global Search** for metadata and keywords across all your Bastions

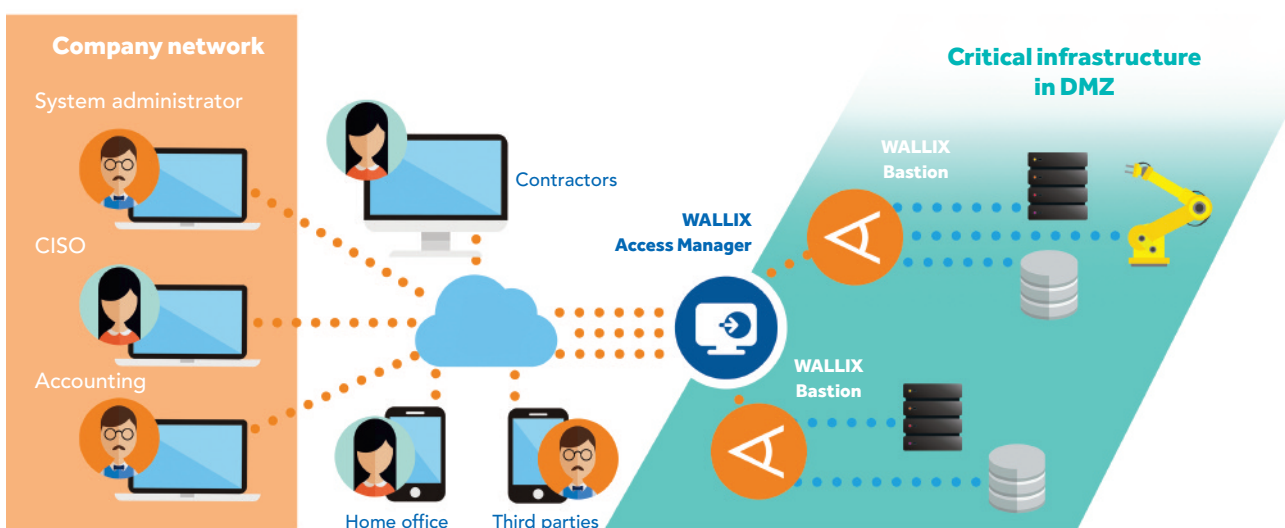

The **WALLIX Access Manager** is deployed upstream of your WALLIX Bastions. It bridges external privileged users with internal critical resources and enhances the WALLIX Bastion with advanced management of external connections. The **WALLIX Access Manager** completes the WALLIX security arsenal.

Enhance your security perimeter

- Integrate the Access Manager with your existing identity management (e.g. SAML)
- RDP and SSH over HTTPS
- Protection against Slow Post attack
- X.509 Certificate management
- Support CA for organizations

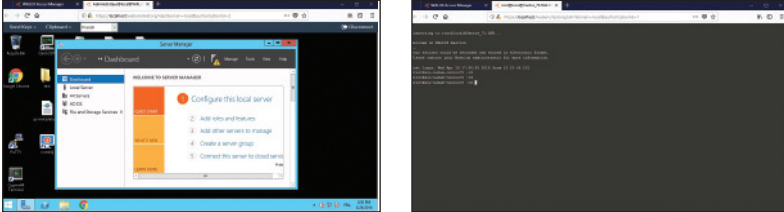

Operational efficiency

- No fat client: no deployment no maintenance no intrusion on user's workstation
- Flexible HTML5 interface providing RDP and SSH consoles
- Dedicated Auditor profile
- Multi-tenant Global search across your Bastions
- Click-on-query to watch specific action of a session

A simple and light alternative to fat client solutions

No need to deploy expensive solutions based on fat clients. Once installed, the **WALLIX Access Manager** provides SSH/RDP access through an HTML5 interface. **You can then drastically reduce your TCO**, as the WALLIX solution does not require fat client deployment nor management. Systems administrators can operate their critical systems using an RDP or an SSH console, directly through a web browser. Using HTTPS technologies also allows you to reduce the number of open ports in your infrastructure.

Monitor your external privileged accounts

The last thing you want is to spread and multiply your resources to monitor activity on your critical assets. Being able to cross-reference your search through multiple Bastions is an efficient way to quickly identify suspicious activity. The **WALLIX Access Manager** can be connected to all Bastions deployed within your organization to provide overall audit capabilities. The **Global Search** feature identifies keywords and metadata of sessions history with the ability to visualize precise actions in the session recording.

The gatekeeper to secure external privileged access

Granting external access to your critical resources requires monitoring multiple entry points/ports at the same time, exposing you to potential vulnerability. Limiting external access to your network is the cornerstone of any sound security policy. The WALLIX Access Manager provides HTTPS connection embedding RDP as well as SSH console. As such, external privileged access is funneled through one entry port without affecting the user experience.

The WALLIX Access Manager

- **Seamless integration** into your existing infrastructure
- **Fully secured external access** reduced to a single controlled entry point
- **Unaltered user experience** thanks to the emulation of RDP and SSH console through an HTTPS connection
- **Reduced TCO**, with no need to install or maintain fat clients, nor to secure multiple entry points in your network
- **Global Search** and centralized audit across multiple Bastions of your infrastructure
- **Access recordings of your sessions** in any of your Bastions by clicking on Global Search query results
- **Multi-tenant solution** to compartmentalize your domains
- **Easily meet compliance regulations** by simplifying the data collection process for GDPR, PCI-DSS, SOX, HIPAA, ISO 27001

The **WALLIX Access Manager** grants secure external access to whoever needs it, without opening a breach in your security.
